

67241 - Magnetic design for electronic systems

Syllabus Information

Academic Year: 2020/21

Subject: 67241 - Magnetic design for electronic systems

Faculty / School: 110 - Escuela de Ingeniería y Arquitectura

Degree: 622 - Master's in Electronic Engineering

ECTS: 6.0

Year: 1

Semester: First semester

Subject Type: Optional

Module: ---

1.General information

1.1.Aims of the course

1.2.Context and importance of this course in the degree

1.3.Recommendations to take this course

2.Learning goals

2.1.Competences

2.2.Learning goals

2.3.Importance of learning goals

3.Assessment (1st and 2nd call)

3.1.Assessment tasks (description of tasks, marking system and assessment criteria)

The final grade of this course is based on the following items:

- Final exam consisting of multiple-choice questions: 40 % of the grade (CT mark)
- Assignments associated to laboratories: 30 % (CL mark)
- Assignment associated to a final project: 30 % (CP mark)

The final mark (CG) is obtained using the following equations:

- $CG_{aux} = 0.4 \times CL + 0.3 \times CT + 0.3 \times CP$
- $CG = CG_{aux}$ if (CT, CL, and CP ≥ 3), otherwise $CG = \min\{4, CG_{aux}\}$

A final mark greater than or equal to 5 is required to pass the course.

4.Methodology, learning tasks, syllabus and resources

4.1.Methodological overview

The methodology followed in this course is oriented towards the achievement of the learning objectives. It is based on participation and the active role of the student favors the development of communication and decision-making skills. A wide range of teaching and learning tasks are implemented, such as:

- Lectures in which the basics of the course are presented.
- Practice sessions in which some representative cases or problems are proposed to students.
- Lab work includes both laboratory experiments and finite-element simulations.

Students are expected to participate actively in the class throughout the semester.

Classroom materials will be available via Moodle. These include a repository of the lecture notes used in class, the course syllabus, as well as other course-specific learning materials.

Further information regarding the course will be provided on the first day of class.

4.2.Learning tasks

The course includes the following learning tasks:

- **A01 Lectures** (20 hours). Lectures are intended to present the basics of the course. Notes and other materials are available on Moodle, the virtual platform of the University.
- **A02 Problem solving sessions** (10 hours). Some selected problems are proposed to students and the solution of these problems is developed in classroom sessions. Notes and other materials are also available on Moodle.
- **A03 Laboratory sessions** (18 hours). Practical activities are intended to reinforce the previously acquired knowledge. These activities include simulation sessions, experiments and prototype development. Instructions, notes and other materials are also available on Moodle.
- **A06 Tutorials** (estimated 6 hours). Tutorials are focused on solving questions about the final project, or about the assignments, and are also intended to guide the learning-teaching process.
- **A08 Assessment activities** (estimated 3 hours). The course is assessed by means off the activities included in the Section III of this document.
- **A06 Course assignments** (estimated 24 hours). Preparation of the lab session reports and the final project report. Reports will be made in small groups (2 or three people).
- **A07 Study** (estimated 69 hours). Study time is oriented to prepare the exam, problems and lab sessions.

4.3.Syllabus

The course will address the following topics:

Theory

- Topic 1. Basics and magnetic components in power electronic applications.
- Topic 2. Power dissipation in magnetics for power electronic applications.
- Topic 3. Inductive power transfer systems
- Topic 4. Analysis and design of transformers.
- Topic 5. Analysis and design of inductances.

Lab sessions

- P1. Power dissipation in magnetics.
- P2. Finite element simulation of inductive power transfer systems.
- P3. Experimental characterization of inductive power transfer systems.
- P4. Design of a power transfer system application.
- P5. Design of the transformer for a high-voltage power supply.
- P6. Prototyping and testing of the transformer for a high-voltage power supply.

4.4.Course planning and calendar

Lectures and practice sessions run for 2 weekly hours. Laboratory sessions will take place every 2 weeks (6 sessions in total) and last 3 hours each.

Further information concerning the timetable, classroom, office hours, assessment dates and other details regarding this course, will be provided on the first day of class or please refer to the EINA website (<https://eina.unizar.es>).

4.5.Bibliography and recommended resources
