

## 60462 - Chemistry at the Frontiers of Biology

### Información del Plan Docente

<b>Academic Year</b>	2016/17
<b>Academic center</b>	100 - Facultad de Ciencias
<b>Degree</b>	543 - Master's in Molecular Chemistry and Homogeneous Catalysis
<b>ECTS</b>	2.0
<b>Course</b>	1
<b>Period</b>	Second semester
<b>Subject Type</b>	Optional
<b>Module</b>	---

### 1. Basic info

#### 1.1. Recommendations to take this course

It is highly desirable to have a degree in Chemistry, although the course is also suited to graduates from related disciplines. Attendance to lectures and continued work has a significant impact on performance .

#### 1.2. Activities and key dates for the course

The information about schedules, calendars and exams is available at the websites of the Sciences Faculty, <https://ciencias.unizar.es/calendario-y-horarios> , the Master, <http://masterqmch.unizar.es> , and the platform Moodle at the University of Zaragoza, <https://moodle2.unizar.es/add> .

### 2. Initiation

#### 2.1. Learning outcomes that define the subject

To establish relationships between structure and chemical properties of natural products and biologically active compounds

To understand changes in biological activity as consequences of structural changes

To design organic synthesis of natural products and biologically active compounds

To design non-natural analogues of biologically active compounds

To understand the biochemical behaviour of the inorganic elements

To know the biochemical activity of essential trace elements

To solve problems and questions with critical thinking

## 60462 - Chemistry at the Frontiers of Biology

### 2.2.Introduction

The subject *Chemistry at the Frontiers of Biology* aims to show the importance of applying chemistry principles to understand biological processes at molecular level and to the preparation of biologically active molecules. The study of the structure, chemical behaviour and function of natural products and compounds of biological interest will be addressed. In addition, the synthesis of simple biomolecules and their corresponding analogues will be covered, and the importance of structural modification for modulating biological activity will be highlighted. On the other hand, the applicability of enzymes as catalysts for asymmetric synthetic transformations will be shown (in particular their use for the preparation of biomolecules in enantiomerically pure form). Throughout the course, those aspects that stand out for its novelty and current interest will be addressed.

### 3.Context and competences

#### 3.1.Goals

To provide them with knowledge on the main organic biomolecules involved in biological processes and the importance of metals in biomolecules and enzymes.

To train students in the design of synthetic strategies for the preparation of biomolecules and its structural analogues in enantiomerically pure form.

To provide insight into the applicability of enzymes in organic synthesis (with focus on the preparation of the main biomolecules).

#### 3.2.Context and meaning of the subject in the degree

*Chemistry at the Frontiers of Biology* is a 2 ECTS optional course, which is taught in the second semester, and it is part of the module *Horizons in Molecular Chemistry and Catalysis*. The course applies concepts of synthetic organic chemistry acquired in previous courses, such as, *Strategies in Advanced Organic Synthesis*, to the preparation of carbohydrates, amino acids, nucleosides and their analogues. In addition, it offers the students insight into the importance of metals in biomolecules (mainly as parts of enzymes) and the applicability of enzymatic catalysis for the preparation of biomolecules in enantiomerically pure form. The impact of this type of catalytic processes from the industrial and technological point of view will be covered.

#### 3.3.Competences

To be able to understand the biochemical behaviour of the main organic biomolecules and inorganic elements

Capacity to recognize the impact that structural changes in simple biomolecules play in their biological activity

To be able to design syntheses of analogues of biomolecules able to mimic the activity of the natural substances

To be able to apply the knowledge of enzymatic catalysis to synthesis

#### 3.4.Importance of learning outcomes

The knowledge and understanding of the subject shall enable students to acquire expertise in the field of molecular chemistry and catalysis. Specifically, they will be able to understand biological processes at the molecular level and be

## 60462 - Chemistry at the Frontiers of Biology

aware of methods for the preparation of biologically active compounds of importance in enantiomerically pure form.

### 4.Evaluation

#### Continuous assessment

This mode of assessment includes the following activities:

- 1.- Attendance and meaningful class participation (20 %).
- 2.- Tutorial work: written report that covers a topic related to the program of contents (20 %).
- 3.- Submission of summary reports of seminars dedicated to highlight outstanding synthetic and technological aspects related to the main biomolecules and their analogues (60 %).

Continuous assessment grade = (0.20 x grade attendance) + (0.20 x grade tutorial work) + (0.60 x grade seminars).  
Minimum mark threshold: 5 out of 10 points.

#### Summative assessment

Students who do not meet the minimum mark threshold during continuous assessment may pass the course in a summative assessment, which will take place according to the official final examination schedule of Universidad de Zaragoza. The summative assessment includes a written exam with questions on important content of the course.

Students have also the option to improve their final grade of continuous assessment in the summative assessment.

The number of official examination calls per registration and their use will be subjected to the statements of the *Regulation of Permanence in Master Studies* and [Regulation of the Learning Assessment](#). The latest document will also regulate the general design and scoring criteria of the assessment activities, as well as the exam schedules and timetable for the post-examination review.

### 5.Activities and resources

#### 5.1.General methodological presentation

The learning methods and strategies designed for the subject are essentially based on lectures that should provide an interactive environment to discuss the course contents, and seminars that should reinforce some of the topics. Specifically, seminars are aimed to address contemporary developments at the frontiers of chemistry and biology. On the other hand, the student will undertake a formative written work that will require conducting a specialized literature search to select a current topic that should reinforce or extend the lecture material.

#### 5.2.Learning activities

Interactive lectures (1.5 ECTS)

## 60462 - Chemistry at the Frontiers of Biology

Seminars (0.5 ECTS)

Tutorial work

### 5.3.Program

Lectures convey the following topics:

1. Chemistry at the frontiers of biology. Biomolecules.

2. Metal-containing biomolecules. Metalloproteins.

3. Carbohydrate chemistry. Chemical glycobiology.

4. Amino acid and peptide chemistry. Non-natural amino acids. Applications.

5. Chemistry of nucleosides and nucleotides. Applications.

6. Asymmetric organic synthesis with enzymes.

### 5.4.Planning and scheduling

The information about schedules, calendars and exams is available at the websites of the [Sciences Faculty](#). Submission of tutorial works and summaries will be held according to the schedule that will be announced in advance in the page for the course at Moodle.

Course materials and readings will be available on the website for the course on the platform Moodle <https://moodle2.unizar.es/add>.
