

Información del Plan Docente

Academic Year 2017/18

Faculty / School 110 - Escuela de Ingeniería y Arquitectura

Degree 434 - Bachelor's Degree in Mechanical Engineering

ECTS 6.0 **Year** 1

Semester Half-yearly

Subject Type Basic Education

Module ---

- 1.General information
- 1.1.Introduction
- 1.2. Recommendations to take this course
- 1.3. Context and importance of this course in the degree
- 1.4. Activities and key dates
- 2.Learning goals
- 2.1.Learning goals
- 2.2.Importance of learning goals
- 3. Aims of the course and competences
- 3.1.Aims of the course
- 3.2.Competences
- 4.Assessment (1st and 2nd call)
- 4.1. Assessment tasks (description of tasks, marking system and assessment criteria)
- 5.Methodology, learning tasks, syllabus and resources
- 5.1. Methodological overview

The methodology followed in this course is oriented towards achievement of the learning objectives. It is based on participation and the active role of the student favors the development of communication and decision-making skills. A wide range of teaching and learning tasks are implemented, such as lectures, guided assignments, laboratory sessions, autonomous work and tutorials.

Students are expected to participate actively in the class throughout the semester.

Classroom materials will be available via Moodle. These include a repository of the lecture notes used in class, the course syllabus, as well as other course-specific learning materials.

Further information regarding the course will be provided on the first day of class. The proposed methodology seeks to encourage the student's continued work and focuses on the most Practices of Statistics: the work with real data.

In the sessions with the complete group, theoretical aspects are treated in the form of a Lecture, that complement each other with its application to solve problems of a real nature in the classes of problems in small groups.

The processing of real data is done in sessions in the computer lab using computer programs, and, in addition, basic problems of Optimization are solved by computer.

The evaluation focuses on both theoretical and applied aspects according to the evaluation criteria established.

5.2.Learning tasks

The course includes 6 ECTS organized according to:

- Lectures (3 ECTS): 30 hours.
- Laboratory sessions (1.5 ECTS): 15 hours.
- Guided assignments (1.5 ECTS): 15 hours.
- Autonomous work: 90 hours.
- Tutorials: 6 hours/week

Lectures: the professor will explain the theoretical contents of the course and solve illustrative applied problems. These problems and exercises can be found in the problem set provided at the beginning of the semester. Lectures run for 2 weekly hours. Although it is not a mandatory activity, regular attendance is highly recommended.

Laboratory sessions: sessions will take place every 2 weeks (6 sessions in total) and last 2.5 hours each. Students will work together in groups actively doing tasks such as practical demonstrations, measurements, calculations, and the use of graphical and analytical methods.

Guided assignments: students will complete assignments, problems and exercises related to concepts seen in laboratory sessions and lectures. Guided assignments run for 1 weekly hour. They will be submitted at the beginning of every laboratory sessions to be discussed and analyzed. If assignments are submitted later, students will not be able to take the assessment test.

Autonomous work: students are expected to spend about 90 hours to study theory, solve problems, prepare lab sessions, and take exams.

Tutorials: the professor's office hours will be posted on Moodle and the degree website to assist students with questions

and doubts. It is beneficial for the student to come with clear and specific questions.

5.3.Syllabus

Kolmogorov axiomatic definition.

Conditional probability. Independence of events.

Modules Module 1: Exploratory data analysis in computer laboratory. Module 2: Models of probability distribution. Module 3: Sampling, estimation and hypothesis tests. Module 4: Introduction to Optimization. Module 1: Exploratory Data Analysis Descriptive statistics Basic concepts. Types of variables. Data organization. Frequency table. Graphic descriptions of a variable. Numerical descriptions of a variable. Box-plot. Bidimensional distributions. Bidimensional table. Marginal and conditional distributions. Measures of association. Regression and correlation. Module 2: Models of probability distribution Basic concepts. Sample space and events, algebra of events. Random and deterministic experiments. Interpretations of probability.

Partition of a consideration of total and all life and Partitions of
Partition of a sample space, law of total probability and Bayes theorem.
Reliability of systems.
Random variables
Definition of random variable. Classification.
Discrete random variable, probability function, distribution function.
Continuous random variable, density function, distribution function.
Expectation of a random variable and of a function of a random variable.
Basic properties of expectation and variance
Moments of a random variable.
Other measures of central tendency and dispersion.
Chebyshev inequality.
Main discrete distributions: Bernoulli, binomial, Poisson, geometric, hypergeometric.
Main continuous distributions: uniform, exponential, normal.
Reproductivity of random variables.
Poisson process: relationship to exponential distribution.
Approximations between random variables.
Two-dimensional distributions. Calculation of expectations and variances of a linear combination of independent random variables.
Module 3: Sampling, estimation and hypothesis tests
Sampling and Estimation
Introduction. Basic concepts associated with sampling distributions in normal populations: chi-square, Student's t, F.

Distributions important statistical sampling: Central Limit Theorem and Fisher theorem.
Confidence interval estimation. Intervals for means, variances and proportions. Calculation of the minimum sample size.
Hypothesis tests: null and alternative hypothesis, level of significance.
Relationship between confidence intervals and hypothesis tests.
Calculating the p-value.
Hypothesis testing for means, variances and proportions.
Chi-square and tests of contingency tables.
Module 4: Introduction to Optimization
Optimization problems
Decision variables, objective function and constraints.
Linear programming problems: graphic resolution.
Contents of Practical classes in computer laboratory
* Uni-dimensional descriptive statistics.
* Instructions for implementation of the Statistical Report.
* Two-dimensional Descriptive Statistics. Regression and correlation.
* Probability distributions of discrete and continuous random variables.
* Test goodness of fit.
* Hypothesis testing for means, variances and proportions.
* Introduction to Optimization.

5.4. Course planning and calendar

For further details concerning the timetable, classroom and further information regarding this course please refer to the

"Escuela de Ingeniería y Arquitectura " website (https://eina.unizar.es/)

5.5.Bibliography and recommended resources

[BB: Basic Bibliography / BC: Additional Bibliography]
