

66344 - Energy efficiency in buildings

Syllabus Information

Academic Year: 2019/20

Subject: 66344 - Energy efficiency in buildings

Faculty / School: 110 - Escuela de Ingeniería y Arquitectura

Degree: 330 - Complementos de formación Máster/Doctorado
535 - Master's in Renewable Energies and Energy Efficiency

ECTS: 5.0

Year: XX

Semester: 330 - Second semester

535 - Second semester

535 - Second semester

535 - Second semester

Subject Type: 535 - Optional

330 - ENG/Complementos de Formación

Module: ---

1.General information

1.1.Aims of the course

1.2.Context and importance of this course in the degree

1.3.Recommendations to take this course

2.Learning goals

2.1.Competences

2.2.Learning goals

2.3.Importance of learning goals

3.Assessment (1st and 2nd call)

3.1.Assessment tasks (description of tasks, marking system and assessment criteria)

4.Methodology, learning tasks, syllabus and resources

4.1.Methodological overview

The methodology followed in this course is oriented towards achievement of the learning objectives. A wide range of teaching and learning tasks are implemented, such as lectures, problem-solving sessions, computer practice sessions, guided assignments, and student participation.

In the **lectures**, the basic concepts are explained and interrelated with short exercises on the board. This serves as support to assure the understanding of the concepts explained.

The **computer practice sessions** consist on practical cases more complex than those presented on the board. Thus, these sessions reinforce and complete the contents developed during the lectures. In these sessions, several cases will be solved through the use of various computer tools, with the support and help of the teacher. Students will have instructions for each session, which they will have previously read and prepared.

The **guided assignments** will be individually made by each student, as an expansion of the practice sessions, solving larger problems than those solved in class. Thus, the autonomous learning of the students is encouraged. Students will be provided with the necessary tools for the development of these tasks. Although the work to be performed is intended as an autonomous activity, it will be presented during the classroom sessions. These assignments will be supervised by the teacher, who will solve any doubts that may arise during its development.

In **tutorials**, the students can voluntarily attend to the teacher's office during office hours in order to ask questions about the course contents. It is highly recommended to ensure adequate progress in the learning process.

During the course, communication between the student and the teacher is managed through the Moodle2 platform of the University of Zaragoza (<http://moodle2.unizar.es>). In this platform the teacher shares the main training materials (notes, questions, problems, previous exams, tables, etc.), and makes some announcements and notifications to students. He also sends and receives emails and offers students online tools for sending reports, works, etc.

4.2. Learning tasks

The course includes the following learning tasks:

- A01 Lectures (25 hours). Presentation of theoretical contents by a faculty or by external experts to all students enrolled in the course. Although it is not a mandatory activity, regular attendance is highly recommended.
- A02 Problem and case solving (13 hours). Solve practical problems and exercises with all the students. Although it is not a mandatory activity, regular attendance is highly recommended.
- A03 Laboratory sessions (12 hours). Students will work actively in groups to solve practical exercises.
- A06 Guided assignments (20 hours). Students will complete assignments, problems and exercises related to concepts seen in laboratory sessions and lectures.
- A07 Autonomous work (50 hours). Students are expected to spend about 50 hours to study theory, solve problems and prepare lab sessions
- A08 Assessment (5 hours).

The indicated hours are for guidance and will be adjusted depending on the academic calendar.

At the beginning of the course, lecturers will communicate the schedule of practice sessions, which will be set according to the syllabus and the availability of laboratories and computer rooms.

4.3. Syllabus

The course will address the following topics:

Topic 1. Introduction: building and sustainability.

Topic 2. Definition of the constructive elements in the thermal envelope of a building. Thermal transmittance and thermal bridges.

Topic 3. Analysis of regulations on energy efficiency in buildings: Technical Building Code - Basic Document of Energy Saving. Limits on energy consumption and thermal demand in buildings (HE0 and HE1), energy efficiency in heating, ventilation and air conditioning -HAVC- systems (HE2), energy efficiency in lighting (HE3), integration of solar thermal energy in buildings (HE4).

Topic 4. Energy balance in a building: heat loss and gain. Calculation of the thermal demand of a building.

Topic 5. Energy certification of buildings. Calculation of the energy rating of a building: Use of the unified tool LIDER-CALENER - solving of practical examples.

Topic 6. Bioclimatic architecture and passive strategies for energy savings in buildings: shape and orientation, climate adaptation, thermal comfort, microclimates, thermal insulation, openings (windows), thermal storage, ventilation, passive heating / cooling, natural lighting, Passive House standard.

Topic 7. Energy Simulation of Buildings: basic concepts. Use of DesignBuilder: geometric definition, thermal demand calculation, improvements' assessment in the buildings envelope. Solving practical examples of energy refurbishment of buildings.

Topic 8. Measuring equipment for buildings: Light-meter, network analyser, clamp meter, thermal imaging camera, thermal transmittance measurement, combustion gas analyser and blower door.

Topic 9. Sustainable building - life-cycle assessment: general methodology, application to products, constructive solutions (EPD) and buildings. Basic principles of bioconstruction.

Topic 10. Methodologies for environmental rating and certification of buildings: LEED and VERDE. Basic principles and assessment indicators. Certification Guides and practical exercises.

Topic 11. Sustainable Urban design: basic concepts.

Practice sessions

- Session 1. Using the unified tool LIDER-CALENER (4 sessions of 2 hours each: 8 hours in total).
- Session 2. Using the building energy simulation tool DesignBuilder (4 sessions of 2 hours each: 8 hours total).
- Session 3. Using the design support tool HADES and criteria assessment in VERDE certification scheme (1 session of 2 hours).

4.4. Course planning and calendar

The assignment reports must be submitted before the final written exam date, which will take place in the corresponding official calls.

Further information concerning the timetable, classroom, assessment dates and other details regarding this course, will be provided on the first day of class or please refer to the EINA website.

4.5. Bibliography and recommended resources
